

FoilX User Manual

May 2026

FoilX is a minimal FoilTeX-inspired LaTeX slide class. It is implemented as `foilx.cls`, loads the standard `article` class, and adds a small set of commands for writing landscape slide decks with large Computer Modern fonts.

This document describes the public interface provided by the current class file. It does not describe features that are not implemented by `foilx.cls`.

1 Overview

FoilX is intended for simple lecture or seminar slide decks. The class sets up letter-sized landscape pages, a large sans-serif default text face, ragged-right paragraphs, slide-friendly list spacing, and a footer that can show the current section and page number.

A typical deck uses the following structure:

- `\maketitle` creates the title page.
- `\makesection` creates a numbered section page.
- `\makefoil` creates each content foil.
- `\makeappendix` switches to appendix numbering.
- `\makereference` creates a bibliography page.

2 Installation

For a single talk, copy `foilx.cls` next to your main `.tex` file:

```
my-talk/  
  talk.tex  
  foilx.cls
```

Then select the class in the usual way:

```
\documentclass{foilx}
```

For regular use, install `foilx.cls` in a directory searched by your TeX distribution, such as a local `texmf` tree. After installation, refresh your TeX filename database if your distribution requires it.

3 Quick Start

The following complete deck uses the main FoilX commands:

```
\documentclass{foilx}

\title{A Short Talk}
\author{Ada Lovelace}
\date{\today}
\info{Example seminar}

\begin{document}
\maketitle

\makesection{Motivation}

\makefoil{A first foil}
\begin{itemize}
  \item FoilX uses large slide-friendly type.
  \item Each foil starts on a new landscape page.
  \item Footers show the current section and page number.
\end{itemize}

\makefoil{A second foil}
\[
  E = mc^2
\]

\makeappendix

\makefoil{Backup material}
Appendix foils are numbered A1, A2, and so on.
\end{document}
```

Compile the deck with a standard LaTeX engine:

```
pdflatex talk.tex
```

4 Class Options

FoilX currently defines one class option:

lecture Reset page numbering at each section and print foil numbers as **section-page**, for example 2-3. Without this option, normal page numbering is used. Appendix foils use A1, A2, and so on in both modes.

Use the option like this:

```
\documentclass[lecture]{foilx}
```

If `hyperref` is loaded in lecture mode, FoilX sets `hypertexnames=false` at the beginning of the document. This avoids duplicate page anchors when page numbers reset for each section.

5 Command Reference

\info{text} Store metadata shown in small type on section title pages. Typical values include a course name, seminar name, or event label.

\maketitle Create the title page using LaTeX's standard `\title`, `\author`, and `\date` values. The title page is numbered internally as page 0, so it does not print a normal footer.

\makesection{title} Start a new numbered section on a new page. The section title is remembered for later foil footers. In **lecture** mode, the page counter is reset to 1.

\makefoil{title} Start a content foil on a new page with a centered title. The footer prints the current section title on the left and the page number on the right.

\makeappendix Start the appendix. FoilX inserts an appendix title page, clears the normal section footer, and numbers later appendix foils as A1, A2, and so on.

\makereference[size]{bib-file} Start a bibliography page using LaTeX's `\bibliography` command and the `alpha` bibliography style. The optional **size** argument defaults to `\small`; pass another declaration such as `\footnotesize` if the reference list is long.

\vf Insert stretchable vertical space using `\vspace*{\fill}`. This is useful for pushing material toward the bottom of a foil.

6 Layout And Typography

FoilX configures the page as landscape letter paper, with an 11 inch width and an 8.5 inch height. It sets the PDF page size to the same dimensions.

The default family is sans serif. Normal body text is set at a large slide-oriented size, with larger display sizes available through the standard `\large`, `\Large`, `\LARGE`, `\huge`, and `\Huge` declarations. Paragraphs are ragged right with no indentation, and lists use wider label spacing suitable for projected slides.

The class loads `fix-cm`, `enumitem`, and `graphicx`. You may load additional packages in your document preamble as usual.

7 Appendix And References

Call `\makeappendix` once before backup slides:

```
\makeappendix
```

```
\makefoil{Additional Details}  
This foil is numbered A1.
```

For bibliographies, create a normal BibTeX file and call `\makereference`:

```
\makereference{talk}
```

This reads entries from `talk.bib`. The class selects the `alpha` bibliography style.

8 Complete Example Deck

This example shows a small lecture-mode deck with title, sections, foils, and appendix material.

```
\documentclass[lecture]{foilx}  
\usepackage{amsmath}  
  
\title{FoilX Demonstration}  
\author{Ada Lovelace \& Charles Babbage}  
\date{\today}  
\info{Analytical Engines 101}  
  
\begin{document}  
\maketitle  
  
\makesection{A Simple Argument}  
  
\makefoil{The Main Idea}  
\begin{itemize}  
  \item A section page introduces a topic.  
  \item Foils after that section show the section title in the footer.  
  \item In lecture mode, this foil is numbered 1--2.  
\end{itemize}  
  
\makefoil{A Formula}
```

```
\[
  \sum_{k=1}^n k = \frac{n(n+1)}{2}
\]
```

```
\makesection{Another Topic}
```

```
\makefoil{A Centered Ending}
Some slide text can appear near the top.
```

```
\vf
```

```
This line is pushed toward the bottom.
```

```
\makeappendix
```

```
\makefoil{Backup}
Appendix numbering is independent of lecture-mode section numbering.
\end{document}
```
